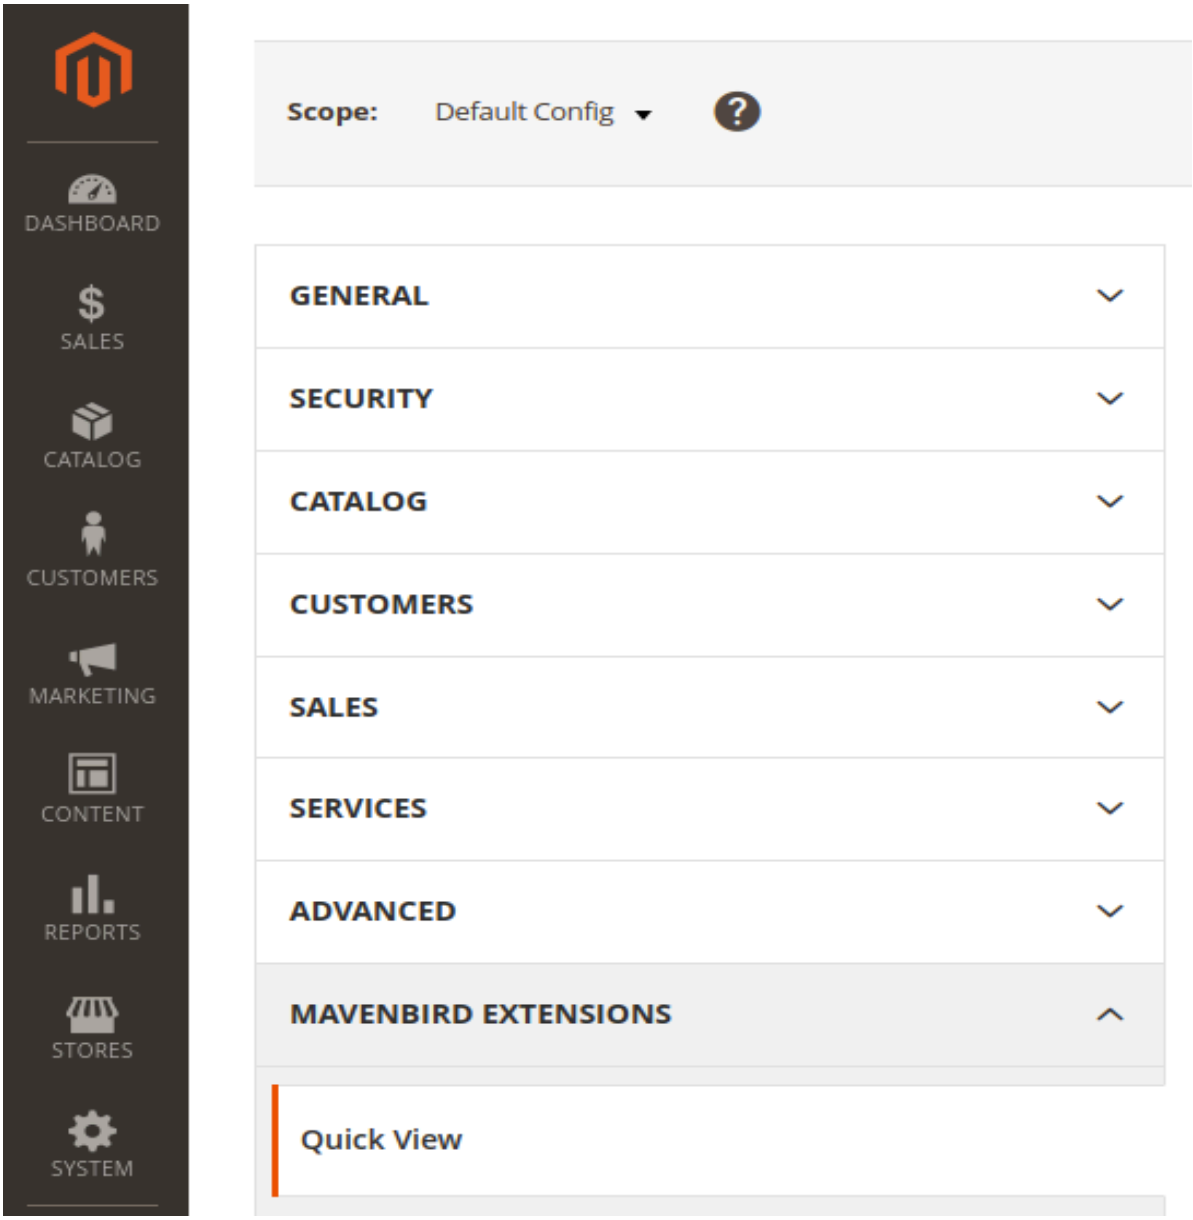
Quick View Menu

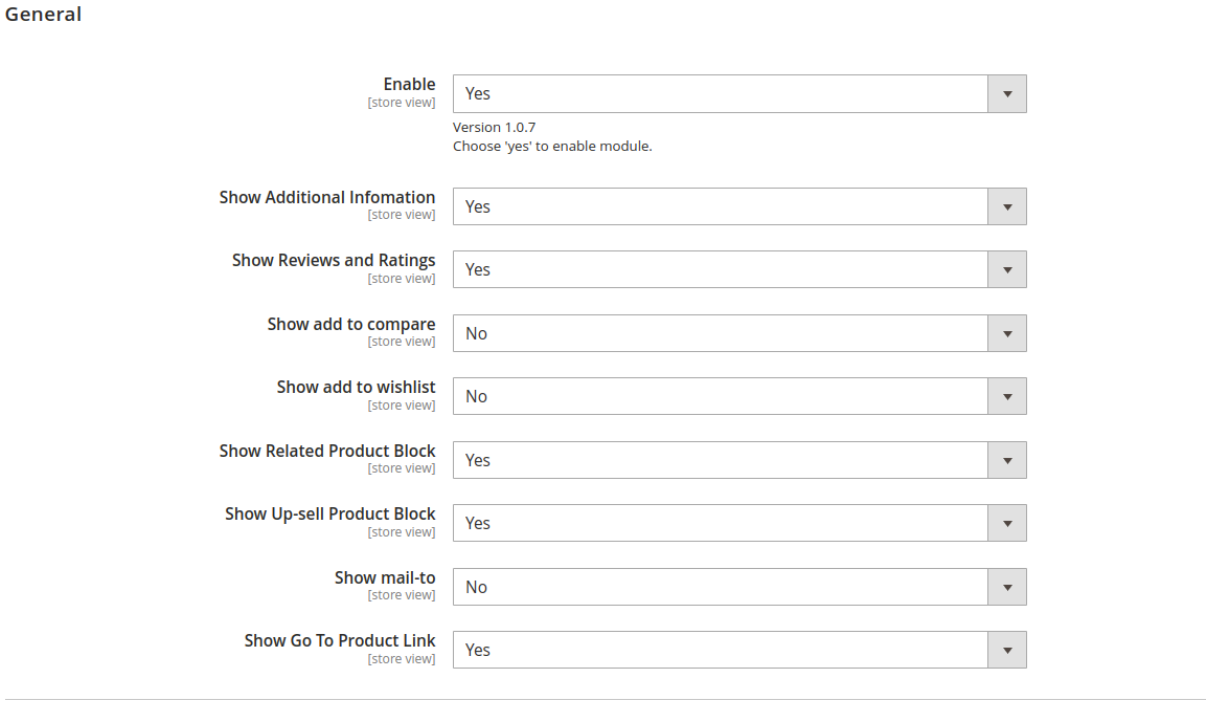


Quick View Button: A prominent button or icon that appears when hovering over product thumbnails in category pages.

Ajax-based: Product information is loaded dynamically using Ajax, ensuring a smooth and fast user experience without reloading the entire page.

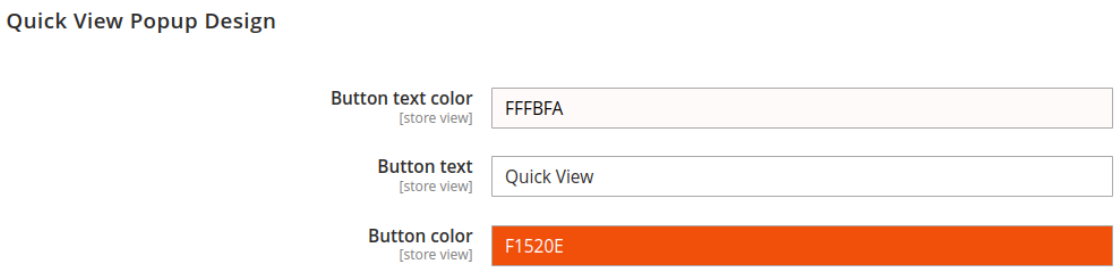
Add to Cart Option: Depending on configuration, customers are able to add items directly to their cart from the quick view popup.

General Settings



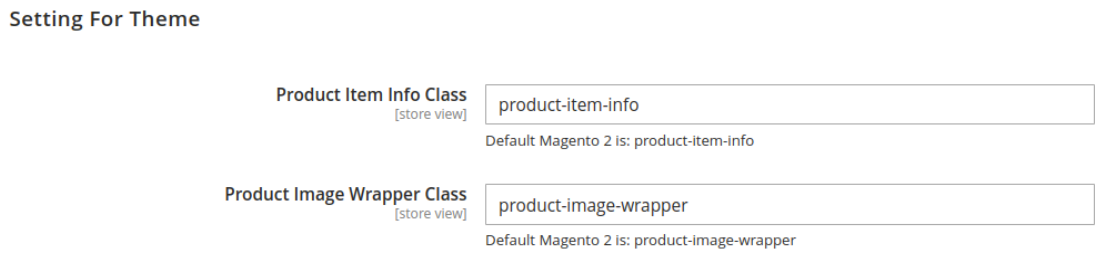
- Enable/Disable Feature: Toggle to globally enable or disable the quick view functionality across the store, providing flexibility during maintenance or updates.
- Button Customization: Options to customise the quick view button's appearance, including size, color, placement (e.g., on hover, always visible), and animations, ensuring alignment with the store's design aesthetic.
- Popup Content Configuration: Settings to define which product details appear in the quick view popup, such as product name, price, description, SKU, availability status, and images, optimizing user experience and decision-making efficiency.

Quick View Popup Design



- **Button Text Color**: Option to choose the color of the text displayed on the Quick View button. This ensures visibility and alignment with the store's color scheme.
- **Button Text**: Setting to define the text that appears on the Quick View button. Typically, this is a short, descriptive label such as "Quick View" or an icon indicating quick view functionality.
- **Button Color**: Ability to specify the background color of the Quick View button. This customization helps the button stand out and catch the user's attention, promoting interaction with the quick view feature.

Setting For Theme

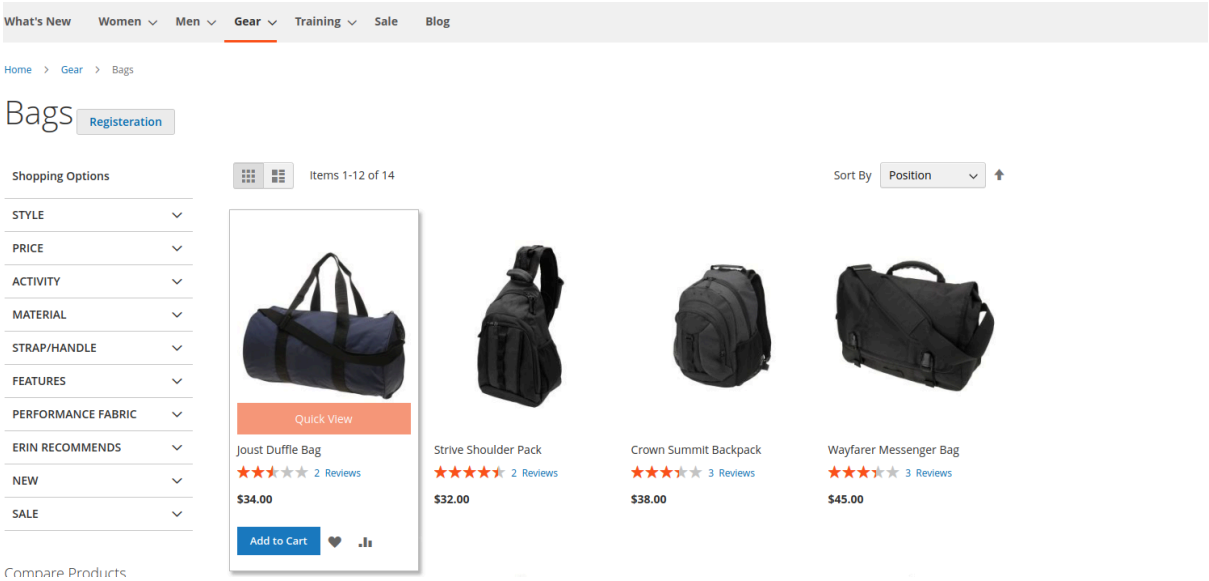


- ☐ The settings for customizing the theme often include options to configure classes for product item information and product image wrappers.

- **Product Item Info Class**: This setting defines the CSS class or classes applied to the container that holds product information such as name, price, and description on category pages or product listings. By customizing this class, administrators can control the layout, styling, and positioning of these details within the theme.

- **Product Image Wrapper Class**: This setting specifies the CSS class or classes used for the container that wraps around product images. It enables administrators to customize the appearance and behaviour of product images, including dimensions, alignment, borders, and any hover effects applied to them in the store's theme.

Product Listing View(Quickview)



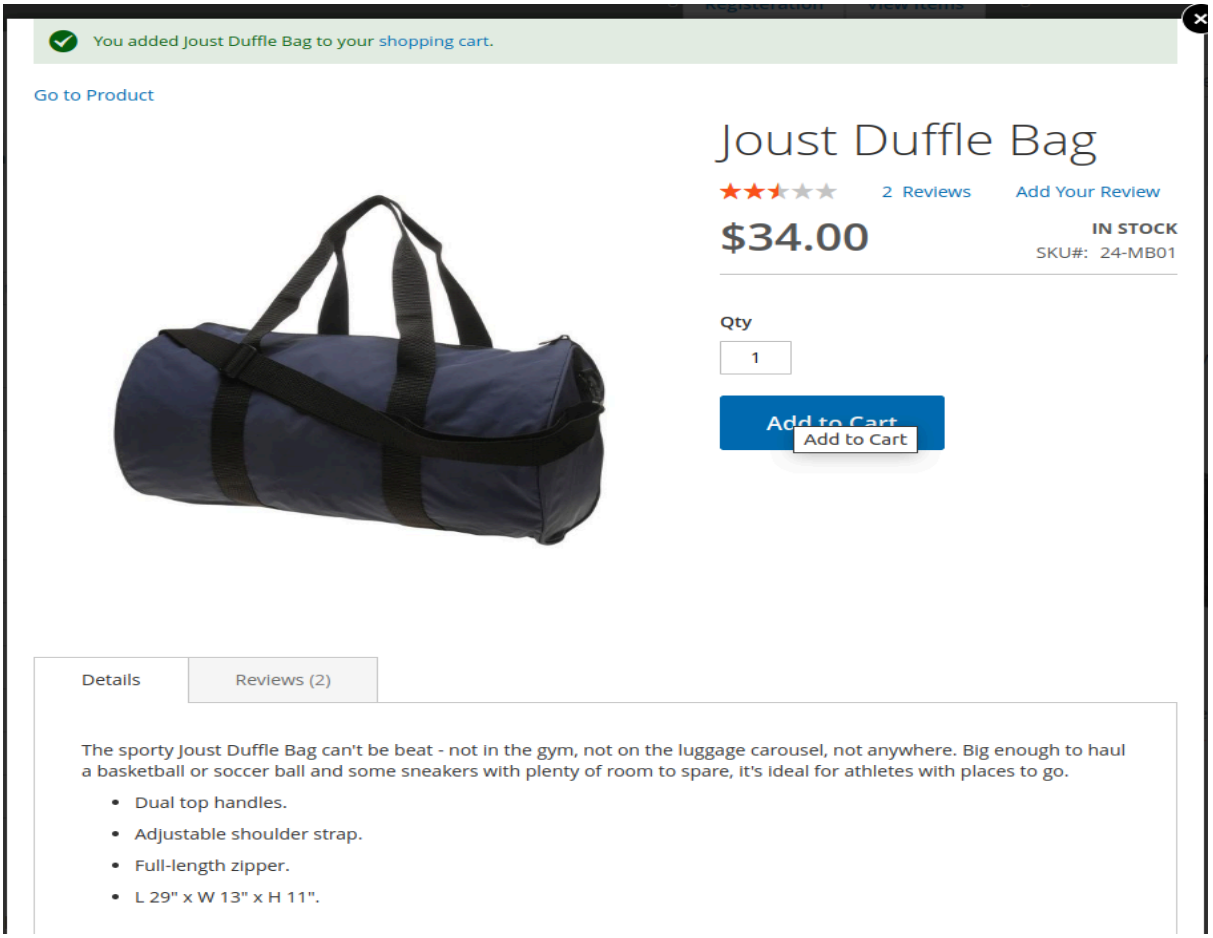
- ☐ Here Looking lots of Products and at which we are visualizing the button effect of Quick View that we added through store/configuration.

- **Quick View Button Integration**: Embeds a centrally positioned Quick View button within each product image thumbnail in category listings.

- **Visual Consistency**: Ensures uniform placement of the Quick View button for streamlined browsing and intuitive user experience.

- **Enhanced Accessibility**: Facilitates easy access to product details without navigating away from the category page, enhancing user engagement and conversion rates.

Go To Products



- ☐ Go To Products typically refers to a feature or setting in Magento or another e-commerce platform that allows administrators or users to directly access and manage product listings.

- **Direct Access**: Provides quick navigation to the list of all products available in the store's inventory.

- **Centralized Management**: Enables administrators to efficiently view, edit, and organize product details such as names, descriptions, prices, and inventory levels.

- **Bulk Operations**: Facilitates bulk actions like updating product attributes, assigning categories, and managing product images for streamlined maintenance.
